

12-core ribbon optical cable splicing method

Overview

Mass fusion splicing is a procedure that saves time and lowers labor costs by simultaneously splicing 12 fibers at a time. The savings is most significant with higher fiber count cables. Discover how to efficiently use sleeves and the heat. Ribbon Fiber Optic Cable is a distinct type of fiber optic cable that features a series of optical fibers attached side-by-side in a flat, ribbon-type format. All ribbon cables utilize fibers that are bonded together in. Splicing fiber inside data centers is a solid, cost-effective method for delivering fiber optic expansion, without the need for pre-determined cables. In order to perform this task, operators need to rely on skilled technicians, but due to the current shortage of these means attempts to deliver. Ribbon cable can be spliced more rapidly by using mass fusion splicing technique. Fusion splicing is the most widely used method of splicing as it provides for the lowest loss and least reflectance, as well as providing the strongest and most reliable joint between two fibers.
