

# Automatic Function Debugging of Distribution Box

## Overview

The protocol communication module includes communication protocols commonly used in power systems, including DL/T 634-104/101, Modbus, and DL645. The module adopts dynamic plug-in mode, which can be flexibly modified, replaced, deleted and added without affecting the stable operation of the entire system. Before testing the product, firstly, scan the QR code and the factory bar code posted on the product. Then, by the feedback provided by the test center cloud, it is determined whether the product is currently in the factory debugging and inspection stage. Finally, the test software receives the product information and executes the test. After the p. Program-controlled source and binary input control module adopt dynamic plug-in mode, support the protocol and conversion of sources from multiple manufacturers, and are compatible with portable relay protection testers, portable standard sources, etc. The database interface is compatible with the SQL server database or the lightweight database sqlite, the latter can facilitate the lightweight operation of the software, and can be used for on-site debugging and testing. The test items are divided into device software debugging, hardware interface test, encryption export, telemetry performance test, remote signal performance test, function test, protection test, etc. According to different categories, there are different configurations. Device software debugging and hardware interface configuration can edit by auto.
