

Calculation of Optical Fiber Amplifier Power

Overview

Calculation Example: This calculator determines the received power (PR) in an optical fiber communication system. Note the presence of a gain peak around 1530nm and. The simulation and design software RP Fiber Power of RP Photonics is an excellent tool for such purposes and has been extensively used for this tutorial. Here, we focus on active fibers, containing some laser-active dopant (s). In this application note, the performance of different erbium-doped fiber amplifiers (EDFAs) is assessed by measuring. 1- The signal is amplified with gain as in the following equation: $(dI/dz) = gI$ but gain g can be saturated: $g = g_0 / (1 + I(z) / I_{sat})$ where g_0 is a characteristic value, and I_{sat} , the saturation intensity is: $I_{sat} = (\hbar \nu_{spont} / (2 \hbar \nu_{stim})) h \nu$ where $\hbar \nu_{spont}$ and $\hbar \nu_{stim}$ are the. s. The gain saturation is occurring in RFA due to the SBS effect, when the input signal exceeds the SBS threshold, a portion of the input signal is reflected in opposite directions with red shift about 0.
