

Can I connect two LC interfaces to one

Overview

Duplex LC connectors mechanically pair two simplex LC connectors into a unified assembly, preserving fixed spacing and polarity between the two fibers. The optical behavior of each fiber remains independent. An SFP duplex LC connector is a fiber optic interface used in many small form-factor pluggable (SFP) optical transceivers to enable full-duplex optical communication. The connector integrates two LC (Lucent Connector) interfaces in a single compact housing, allowing one fiber to transmit optical. An LC connector is a 1. Its compact size, low-loss performance, and compatibility with industry-standard transceivers (SFP/SFP+/SFP28, etc.) make it the default choice for most high-density patch panels and equipment connections. If you've. Is this one single strand of fiber or 12/24/144/etc?

If splicing them together isn't an option, what I've seen done is having cable A (multiple strands) terminated into a patch panel right next to another patch panel where cable B will be terminated. LC connectors have a simplex design, meaning they can only accommodate one fiber. In addition to what Soroush provided, you usually have 2 strands of fiber cables that make up a pair.
