

Catalyst beam splitter splitting ratio

Overview

The split ratio of light transmittance and reflectance is 1:1 and is called a half mirror. Good fit for large beam size applications at a reasonable price. Beamsplitters are optical components used to split incident light at a designated ratio into two separate beams. a laser beam) into two (or sometimes more) beams, which may or may not have the same optical power (radiant flux). Newport offers a wide variety of Beamsplitters in various shapes. Circular beamsplitters, plate beamsplitters and cube beamsplitters can be purchased for polarizing or non polarizing beamsplitting. Here, we proposed a polarization-insensitive beam splitter with a variable split angle and ratio based on the phase gradient metasurface, which is composed of two types of nanorod arrays with opposite phase gradients.
