

Characteristics of the Optical Flow Module

Overview

Optical Flow uses a downward facing camera and a downward facing distance sensor for velocity estimation. It can be used to determine speed when navigating without GNSS — in buildings, underground, or in any other GNSS-denied environment. As an essential component of optical fiber communication, optical modules are optoelectronic devices that facilitate the conversion between optical and electrical signals during the transmission process. Optical flow can also be defined as the distribution of apparent velocities of movement of brightness pattern in an. Optical flow is foremost a human phenomenon, and it refers to our visual perception of motion, caused by either the movement of the observer or the motion of the objects in our environment. To put this into context, see if you can recall sitting on a train gazing out of the window, and picture the.
