

Design of an integrated optical transceiver module

Overview

This paper proposes a design for an integrated optoelectronic transceiver module for IFOG, incorporating a superluminescent laser diode (SLD) light source, beam splitter, photodetector (PD), and transimpedance amplifier (TIA). The rapid advancement in integrated optics offers a viable approach for further reducing the size and weight of interferometric fiber optic gyroscopes (IFOGs) by integrating optoelectronic transceiver modules. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. As electrical I/O approaches inherent bottlenecks in reach, energy efficiency, and bandwidth density, integrated optical transceivers are becoming critical enablers for scaling data center and accelerator interconnects. These modules perform the critical function of converting electrical signals into optical signals, and vice versa. 4dBm OMA sensitivity at the KP4. The fabrication and assembly of 3D optical modules based on active interposer-integrated edge couplers and TSV are realized in this paper.
