

Does a KVM switch require an external power supply

Overview

Many KVM switches draw power from the connected computers and do not require an external power source. Check the specifications of your KVM switch to determine its. I do have a slight preference for a KVM switch that only turns on whenever 1 of the PC systems is turned on, rather than being connected to DC power and left on constantly (less switch flicking, the better). So far I have shortlisted 2 from Amazon. (I've attached photos) Option 1 - KCEVE: This one. A KVM (keyboard, video, mouse) switch is a hardware device that allows a user to control multiple computers from a single keyboard, video monitor, and mouse. The term "KVM" refers to the ability to manage keyboard inputs, video display, and mouse controls from one central setup, eliminating the need for. According to Wikipedia, PS/2 provides 5V DC, which is I assume how it is getting powered, as VGA isn't designed to power devices. So what my question is, is why does it even have a barrel connector, if it gets fully powered by PS/2?

Do some older computers with PS/2 not provide power or something?

That's because your KVM switch needs to be connected to all your peripherals and connected to every device to be served.
