

Fiber Optic Multimode Cold Connector Connection Method

Overview

Fiber optic cold connection, also known as mechanical splicing, is a widely used method of connecting optical fibers in a network. Unlike fusion splicing, which uses heat to join two optical fibers together, cold connection uses mechanical means to create a stable and low-loss. Active connection utilizes various fiber optic connectors (plugs and sockets) to connect site-to-site or site-to-cable. This method is flexible, simple, convenient, and reliable, commonly used in building computer network cabling. The typical attenuation is 1dB per connection. It allows connections. Next, we'll explain the principles of optical fiber, comparing its advantages and disadvantages, fiber materials and transmission quality, the differences between single-mode and multimode, application distances, fiber's applicable environments and scenarios, fiber connector types, and more.
