

Fiber Optic Switch Concept

Overview

A fiber optic switch is an electronic device that allows multiple fiber optic cables to be connected and selectively route data between them. The switch receives data packets from one input fiber optic cable and forwards them to the appropriate output cable based on their destination. Fiber-optic switches control light paths within fiber optics, ranging from simple on/off types to complex matrix configurations like 64×64. They are used in a wide range of applications, including telecommunications, data centers, industrial automation, and military and aerospace. Without optical switching, each wavelength would need to be. A fiber optical switch, also known as a fiber channel switch or a SAN (Storage Area Network) switch, is a high-speed network transmission relay device.
