

# Fiber optic grids can function without routers

## Overview

Fiber internet is different from regular internet services. Fiber optic cables send data using light pulses, which are already digital. This means we don't have to change the signals. Your devices talk digitally, so there's no need to. Fiber internet doesn't need a modem because it uses a fundamentally different technology from cable or DSL. Keep reading to find out how this works, what equipment you'll need, and what to expect from a fiber. Fiber optic networks enable the transfer of vast amounts of data at the speed of light, ensuring real-time communication across the grid. Delays in communication can result in inefficiencies or. Fiber network adapters allow for high-speed fiber connections directly to your computer without converting to copper Ethernet cable.
