

Grounding relay protection device

Overview

They are designed to protect individuals from electric shock by detecting very small ground fault currents (typically around 5mA) and tripping the circuit within milliseconds. GFCIs work by monitoring the current balance between the hot (line) and neutral conductors. When conditions for a ground fault exist. Ground fault protection or monitoring from 30mA to 30A Used at all levels of an installation: power distribution, industrial control and final distribution, as well as with a variety of OEM equipment. Quickly and easily find the right products and accessories for your applications. Why?

If you get a second ground fault on adjacent phase, watch out! Why the power system needs to be. While ground-fault protective schemes may be elaborately developed, depending on the ingenuity of the relaying engineer, nearly all schemes in common practice are based on one or more of the methods of ground-fault detection discussed in this article. Distribution circuits that are solidly grounded.
