

Hazards of Communication Base Station Towers

Overview

Cell towers drop property values, create fire risks, and emit radiofrequency (RF) radiation. Children absorb higher rates of cell tower radiation and are biologically more vulnerable to the RF radiation emitted by cell towers, a fact that has long been acknowledged by medical. These towers have electronic equipment and antennas that receive and transmit cell phone signals using radiofrequency (RF) waves. Cell phone towers are still relatively new, and many people are understandably concerned about whether the RF waves they give off might possibly have health effects. At. Base stations transmit and receive radio waves to connect the users of mobile phones and other devices to mobile communications networks. The strength of the radio waves from base station antennas reduces rapidly with increasing distance and the levels at locations where the public can be exposed. We work to strengthen radiation protection of the public, patients and workers worldwide. Mobile telephony is now commonplace around the world.
