

# Is gyftzy an ADSS fiber optic cable

## Overview

The difference between GYFTZY optical cable and ADSS optical cable: GYFTZY optical cable mainly refers to non-metallic optical cable, which has the characteristics of water blocking and flame retardant. ADSS optical cable is an all-dielectric self-supporting optical cable. It is used by electrical utility companies as a communications medium, installed along existing overhead transmission. GYFTZY (non-metallic strengthening member, flame retardant, loose tube layer-stranded filling type, polyethylene sheath) non-metallic flame-retardant optical cable (general power optical cable adopts layer-stranded type) is basically the same as in GYFTY, mainly based on GYFTY optical cable. The fibers are positioned in loose tubes that are made of high-modulus plastic and filled with tube gel. The tubes (and fillers) are stranded around a non-metallic central strength member to form a cable core. Then, a LSZH outer jacket is extruded. This cable is specifically designed for harsh environments where traditional metal cables may corrode or be damaged.

All-dielectric self-supporting cable

Overview Construction details Accessories and installation Application issues

All-dielectric self-supporting (ADSS) cable is a type of optical fiber cable that is strong enough to support itself between structures without using conductive metal elements. It is used by electrical utility companies as a communications medium, installed along existing overhead transmission lines and often sharing the same support structures as the electrical conductors. ADSS is an alternative to OPGW and OPAC with lower installation cost. The cables are designed to be s
