

Lighting Distribution Box Model Classification

Overview

The lighting distribution box is divided into two types based on installation methods: closed hanging type (surface-mounted) and embedded type (flush-mounted). The main structure consists of components such as the box shell, panel, installation bracket, neutral busbar, and. The Illuminating Engineering Society of North America (IESNA) has a classification system for light distribution types that describes how light spreads out on a horizontal plane. Improper distribution often leads to a host of issues, including: Glare: Uncomfortably bright light directly aimed at the eyes, causing. There are five primary types of light distribution (I, II, III, IV, V), each designed for specific applications to maximize illumination and comfort. Choosing the right light distribution type is crucial for enhancing safety, visibility, and aesthetic appeal in various environments, including. Light distribution is basically the projected pattern of light a fixture will disperse onto a surface. This provides adequate lighting for smaller pathways. Type I is a two-way lateral distribution having a preferred lateral width of 15° in the.
