

Mesh cable tray jumper connection method

Overview

The answer: use the right connection accessories for a secure, aligned and continuous cable support system. In most cases, sections of wire mesh baskets or electrical cable trays are joined using couplers, bolts, or proprietary connector kits. These systems support and route all types of cables. Depending on the type and version of mesh cable tray, as well as the corrosion protection used, the mesh cable tray systems can be used in ambient temperatures of - 20 °C to + 120 °C. The following pages address the 2014 National Electrical Code® requirements for cable tray systems as well as design. When completely installed, without damage either to conductors or structural system use maintain spacing or to keep cables in place when the tray is bent the minimum bend radius for cables as they exit the bottom of the cable tray. These ensure the sections remain structurally sound. A Common Bonding Network (CBN) Jumper is the electrical connection between the cabinet/rack bonding bus bar and the common bonding network, which can be below a raised floor (also called SRG or Signal Reference Grid) or overhead, as in the industrial environment.
