

Method for fabricating 90° elbows in cable trays

Overview

Creating a 90-degree elbow in an electrical cable tray, often called a "fabricated" or "mitered" bend, involves cutting, bending, and fastening a straight section of tray. The most common method involves creating two 45-degree cuts to form a 90-degree angle. The length of the bottom side (bottom diagonal) after bending the cable tray should be equal to the width of the cable. Here is the simple solution Create two type : 90 elblow and 45 elbow In the real world, to make a 45 elbow, we need two segments, to make a 90 elbow, we need three segments I've also tried to use some geometry forms in revit but no hope. 11-09-2024 01:19 AM Thank you, anyway I will mark your. The first step is to mark out the tray (A). Construction of a flat 90° bend (A) The amount of tray lip to be removed is equal to 2, 3/4 the width of the tray, half of this measurement will be removed on either side of the centre line. To remove the lip we can use a small hand grinder (B) or a file. This manual is designed to guide workers through the detailed production process of ladder cable trays, including the manufacture of horizontal elbows, tees, crosses, reducing bends, and vertical bends, with emphasis on precision, safety, and quality control.
