

Method for splicing optical cables broken on iron towers

Overview

Fusion splicing is the most common and permanent method, where two fiber ends are fused together using heat, typically from an electric arc. This method provides the lowest signal loss and is ideal for long-term or high-performance applications. For network managers and technicians, a poor splice can lead to significant signal degradation, network downtime, and costly troubleshooting. Fusion splicing has been around for several decades. In this guide, we cover the basics of fiber optic splicing, how to perform splicing using two different methods, and finally some best practices to perform good fiber splicing. Ensure Your Splicing Tools are Clean - #2. The fiber optic cables of various lengths like more than 5kms, 10kms, etc. This technique ensures high-performance data transmission and is essential in extending cable runs, repairing broken links, or establishing new network paths in data.
