

Multimode fiber simulation in COMSOL

Overview

This study employs COMSOL Multiphysics to comprehensively analyze single-mode and multimode fiber beam profiles, encompassing diverse parameters such as wavelengths and modal distributions. Single-mode step-index fibers are used for long-haul (even transoceanic) communication, whereas both graded-index (GRIN) and step-index multimode fibers are used for short-distance communication, for example, within institutions and university campuses and buildings. For almost all commercial. Hello Engineers, This video is about how to design a step-index multi-mode optical fiber and find the mode fi. We also learn about COMSOL's 'Parametric Sweep' technique to vary the bending radius over a range and study how the different values of bending radius affect the modes. The investigation of beam profiles is based on 850nm, 1310nm and 1550nm wavelengths; with three different. and select the line segment in the fiber geometry or which radius do you have aPART - 1:This tutorial consist of two parts: #Part 1 of the video includes fiber parameter, fiber geometry and selection of material properties and the rest.
