

Multimode optical cable contains how many optical fibers

Overview

Identified by ISO 11801 standard, multimode fiber optic cables can be classified into OM1 fiber, OM2 fiber, OM3 fiber, OM4 fiber and newly released OM5 fiber. The next part will compare these fibers from the side of core size, bandwidth, data rate, distance, color and optical. Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode links can be used for data rates up to 800 Gbit/s. This is made possible by its relatively large core diameter, typically 50 or 62.5 microns, compared to the ~9-micron core in single-mode fiber. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets.
