

New Fiber Optic Communication Technologies ofdm

Overview

Multi-carrier techniques such as OFDM (Orthogonal Frequency Division Multiplex) and DMT (Discrete Multitone) are already successfully applied in wireless and DSL (Digital Subscriber Line) systems. To optical communications, this technique is new and not yet studied and. OFDM is a multicarrier modulation technique that divides the available bandwidth into multiple orthogonal subcarriers. Each subcarrier is modulated with a low-rate data stream, and the subcarriers are spaced at a minimum frequency separation that ensures orthogonality. Because to its disappearing cell borders and robust macro-diversity, cell-free massive (CF) high-capacity.
