

OLT replaces the core switch

Overview

OLT is the main driver of the FTTH system functioning to convert the optical signals to electric signals and relay them to a core Ethernet switch. OLT replaces multiple layer 2 switches at distribution points connected with backbone cabling or horizontal cabling via. In short: The OLT (Optical Line Terminal) is the central control unit of a Passive Optical Network (PON). It converts data signals, manages bandwidth, and connects hundreds of users over a single optical fiber infrastructure. What is an OLT?

Definition: An Optical Line Terminal (OLT), also called. Traditional campus networks typically use a three-layer switch setup (core, convergence, and access), but now we have Passive Optical LAN (POL) that offers a more streamlined, eco-friendly, and powerful option. In this article, we will introduce the basics of PON, which mainly. Fiber-to-the-Office replaces traditional copper LAN infrastructure with a centralized PON-based architecture.
