

Optical module LRM

Overview

LRM means Long Reach Multimode, these transceivers support distance up to 220m over multi-mode fiber and use 1310nm lasers. Each module is designed for different fibre distances and environments, making it important to understand their characteristics before selecting the appropriate option for your network. SFP refers to a small form-factor module that can be hot-pluggable. 10GBase-SR is the original multimode optics specification and is still by far the most commonly used. 10GBase-SR it uses a single, low-cost solid-state laser assembly, it is also. A 10GBASE-LRM SFP module is designed to deliver 10G Ethernet over legacy multimode fiber, solving a common problem in enterprise and data center networks: achieving longer reach without replacing existing cabling. It fills the gap between short-reach 10G SR optics and long-reach single-mode. However, facing the numerous models on the market, such as LRM, SR, LR, ER, ZR and other optical modules, how to choose the most suitable module becomes a key issue. In this article, ETU-LINK will deeply analyze the differences between different 10G SFP+ dual-fiber optical modules from multiple. There are currently many models of SFP+ optical modules on the market, such as SFP-10G-SR optical modules for multi-mode transmission, SFP-10G-LR optical modules for single-mode transmission, and SFP-10G-LR optical modules that can be used for both single-mode transmission and SFP-10G-LRM optical. Deploying a 10G network requires careful selection of optical transceivers to ensure performance, cost efficiency, and compatibility. Among the most widely used 10G SFP+ modules are SR (Short Reach), LR (Long Reach), and LRM (Long Reach Multimode).
