

Optical module threshold is 0

Overview

Check the diagnostic information, which shows that the received optical power is low, with a threshold of -3 to -23. Troubleshoot the link, and if the link is normal, replace the optical. You can enable the alarm standardization function for an optical module to prevent the optical module from reporting alarms when its optical power exceeds the threshold. `gpon optical-transceiver voltage low-limit enable threshold 0 10` The following command shows how to enable the current alarm on PON port, set the maximum and minimum values, and clear the alarm thresholds. The five parameters have basically decided whether the optical module can work normally. If one of the five parameters is abnormal, ONU registration will be abnormal or packet rate will be low for the PON port. DWDM wavelength fraction = 1310. Transceiver is internally calibrated. ++ : high alarm, + : high warning, - : low warning, -- : low alarm.
