

Optical power meters can emit light sources

Overview

Optical power meters are available as stand-alone bench or handheld instruments or combined with other test functions such as an Optical Light Source (OLS), Visual Fault Locator (VFL), or as a sub-system in a larger or modular instrument. Overview An optical power meter (OPM) is a device used to measure the power in a signal. The term usually refers to a device for testing average power in systems. Other general purpose light power measuring. The major types are (Si), (Ge) and (InGaAs). Additionally, these may be used with attenuating elements for high optical power testing, or wavelength. A typical OPM is linear from about 0 dBm (1 milli Watt) to about -50 dBm (10 nano Watt), although the display range may be larger. Above 0 dBm is considered "high power", and specially adapted units may measure μ .
