

Passive optical devices in ODN

Overview

Key components of a Passive Optical Network include the Optical Line Terminal (OLT), Optical Network Unit (ONU) or Optical Network Terminal (ONT), Optical Distribution Network (ODN), and Optical Splitters. An OLT is a device used to interface between the service provider's central. The Passive Optical Network (PON) is the indispensable foundation for delivering ubiquitous, multi-gigabit broadband connectivity, a necessity for modern economies and residential life. PON primarily utilizes a point-to-multipoint topology and fiber optical splitters to transmit data from a single point of transmission to multiple user. This article will introduce passive optical networks (PON), in which we will introduce everything about OLTs, ONTs, ONUs, and ODNs, including their operation principles and functions. It has been deployed on a large scale in China since 2006, expanding from initial residential and commercial user access to large.

A passive optical network (PON) is a fiber-optic telecommunications network that uses only unpowered devices to carry signals, as opposed to electronic equipment. In practice, PONs are typically used for the last mile between Internet service providers (ISP) and their customers. In this use, a PON has a point-to-multipoint topology in which an ISP uses a single device to serve many end-user sites using a system suc
