

Polarization-maintaining fiber optic transmission

Overview

Polarization-maintaining fibers work by intentionally introducing a systematic linear birefringence in the fiber, so that there are two well defined polarization modes which propagate along the fiber with very distinct phase velocities. In fiber optics, polarization-maintaining optical fiber (PMF or PM fiber) is a single-mode optical fiber in which linearly polarized light, if properly launched into the fiber, maintains a linear polarization during propagation, exiting the fiber in a specific linear polarization state; there is. Polarization-maintaining fibers are mostly single-mode fibers, only in rare cases few-mode fibers, and apparently never highly multimode fibers. The field distribution (mode field) of the light exiting the fiber is close to Gaussian.
