

# Power Line Carrier Channel and Fiber Optic Channel

## Overview

Power-line communications systems operate by adding a modulated carrier signal to the wiring system. Different types of power-line communications use different frequency bands. Since the power distribution system was originally intended for transmission of AC power at typical frequencies of 50 or 60 Hz, power wire circuits have only a limited ability to carry higher frequencies. The p. OverviewPower-line communication (PLC) is the carrying of data on a conductor (the power-line carrier) that is also used simultaneously for AC or to consumers. A wide ran. Appearing as early as 1925, carrier equipment for power lines was designed for use by electric utility companies to facilitate communication with technicians operating high voltage electrical equipment, which was often I. Although different protocols and legislation exist throughout the world, there are basically only two types of PLC: the indoor PLC and the outdoor PLC. • Indoor PLC: indoor PLC is used for LAN networking.
