This presentation reviews the established principles and the advanced aspects of the selection and application of protective relays in the overall protection system, multifunctional numerical devices application for power distribution and industrial systems, and addresses. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. The selection and applications of. The selected protection principle affects the operating speed of the protection, which has a significant im-pact on the harm caused by short circuits. The faster the protection operates, the smaller the resulting ha-zards, damage and the thermal stress will be. It is well known that relay protection and automation devices function efficiently, including high speed of response, selectivity. Abstract: This paper introduces the importance of comprehensive relay protection device, the key role it plays in the power system, the verification cycle and maintenance content of relay protection device, and improves the utilization efficiency of equipment and reduces the maintenance cost of.
