

Relay protection for line transformer groups

Overview

This guide provides a comprehensive overview of various transformer protection schemes and offers recommendations for relay selection, coordination, and settings. Another important standard is the IEC 61850, which focuses on communication protocols for substation automation systems. Setting procedures are only discussed in a general nature in the material to follow. The facilities to which this Document applies are generally comprised of the following: In analyzing the relaying practices to meet the broad objectives set forth, consideration must. Abstract: Guidelines for protecting three-phase power transformers of more than 5 MVA rated capacity and operating at voltages exceeding 10 kV is provided to protection engineers and other readers in this guide. Relay protection of transformers is most often used for transformers rated 10 MVA and above although there are transformers up to 30 MVA that are protected by fuses. These harm time during each cycle where the current magnitud unit (PU) on transfo acteristics that relate fault-current magnitude to.
