

Secondary Pump Station Distribution Box

Overview

The Secondary Distribution Box (SDB) receives power from Main Power Distribution box via an extender cable and provides a central power distribution to feed normal branch circuits to the electric floor modules through snap-on extender cables. A feeder usually begins with a feeder breaker at the distribution substation. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. At this. Volume 3 in this update is split into six sub-volumes, as following tables, for easy reference and timely update of individual sub-volume to address industry requirements and technological advancements. The following is a list of revisions in Vol. 3-04: Pump Station and Forcemain Design Guidelines. This allows multiple pumps to be driven simultaneously from a single power source. Thanks to the modular design, they can be perfectly tailored to any. This manual provides information and criteria pertinent to the design and layout of civil works flood control pumping stations.
