

Superstructure Long Period Fiber Grating

Overview

Structure-Modulated Long-Period Fiber Gratings (SM-LPFGs) represent an advancement in fiber optic sensor technology, moving beyond traditional photosensitivity-based fabrication to achieve enhanced performance through the direct physical modification of the geometry of the fiber. This review. In essence, a long period fibre grating (LPFG) is an all-fibre device with wavelength dependent loss. As a band rejection filter, all light in a spectral slice is discarded without affecting the amplitude and phase of neighbouring wavelengths, with the additional advantage of low insertion losses. In this work, we review the most important achievements of INESC TEC related to the properties and applications of arc-induced long-period fiber gratings. One remaining issue is the separation of the strain-induced wavelength shift from that induced by temperature changes.
