

What does optical module incompatibility mean

Overview

It is a system-level compatibility condition that spans physical geometry, optical behavior, and operational assumptions. A. Most optical modules with the same size but different speeds cannot be interconnected, with the exception of SFP+10G optical modules mentioned above. 5Gbps, 5Gbps, and 10Gbps by using Cat5e/Cat6/Cat6a cables. However, there still exists the concerns about the quality, interoperability, and compatibility issues when choosing the optical transceivers. But in general, the same standard optical modules made by various optical module manufacturers are all fully functional, so why. As an important part of fiber-optic communication, an optical module is a photoelectric converter which converts electrical signals into optical signals and vice versa.
