

What's behind the optical module

Overview

An optical module is mainly composed of optoelectronic devices (including the optical transmitter and optical receiver), functional circuitry, and optical interfaces. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. As an essential component of optical fiber communication, optical modules are optoelectronic devices that facilitate the conversion between optical and electrical signals during the transmission process. As the demand for faster and more reliable internet and data services grows, understanding these devices becomes increasingly important. This guide will explore. Modern communication networks rely on optical transceivers to transfer data at the speed of light.
