

Where are optical receivers used

Overview

Optical receivers appear anywhere fiber optic cable is used. In telecommunications, they sit in equipment at central offices, cell tower base stations, and the terminal boxes that bring fiber to homes. It's the endpoint of any fiber optic link, sitting at the far end of the cable and translating pulses of infrared light into the ones. Nowadays, the applications of optical fibers mainly involve in telecommunication systems and also in the Internet & LAN (local area networks) to attain high signaling rates. The optical fiber communication module mainly includes transmitter module like PS-FODT as well as receiver module like. Optical receivers are mainly used in CATV systems, broadband access networks and large-scale optical fiber communication networks.
